Synthetic Budget-Matched Study

Synthetic teaching material. Preset analysis, not live model output.

1 Introduction

We compare two algorithms under the same training budget.

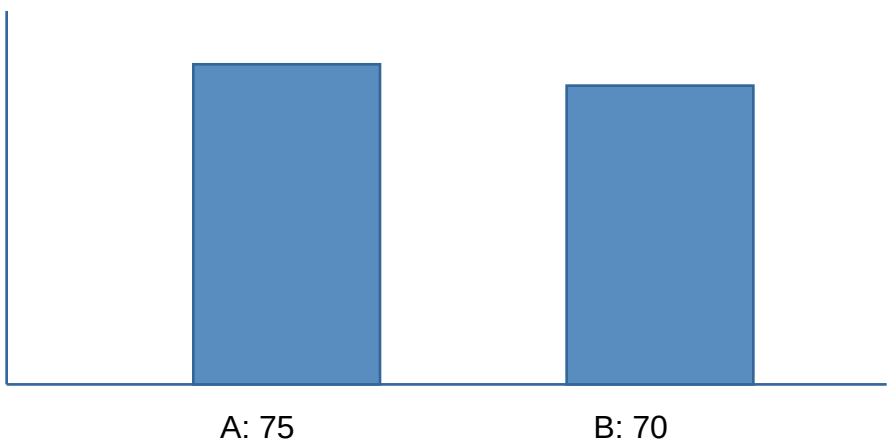
The proposed rule chooses observations before updating the estimate.

A higher score alone does not establish generalization to new tasks.

2 Evidence

Algorithm A scores 75 and algorithm B scores 70 in this synthetic example.

Both use ten updates. No uncertainty interval is available.



Teaching illustration only; not a published experiment.
